

UNMANNED AERIAL MONITORING AND INFORMATION MANAGEMENT OF AGING STRUCTURES

School of Electrical, Electronics and Computer Engineering

OUTLINE

- Background of the topic
- Statement of the Problem
- Objectives
- Significance
- Scope
- Methodology

BACKGROUND

STATEMENT OF THE PROBLEM

- The main problem is that merely relying on visually inspecting an aging structure using the human eye can differ in results from one inspector to the other.
- Also, some clear sign of a major damage may be out of sight to the human eye and the safety of the inspectors maybe at risk while doing the inspection.

OBJECTIVES

Main Objectives:

- Develop a system that will autonomously gather, process and transmit the status of the old buildings and bridge condition.
- Develop an app for information management

Specific Objectives:

- Use an unmanned aerial vehicle capable of acquiring sufficient data on favorable flying conditions.
- Develop a robust system to autonomously perform the necessary process in raw data gathering.
- Develop an efficient post-processing algorithm to simplify the raw gathered information into segmented aging structure condition data.
- Develop an app that will update in regular intervals the status of aging structure condition data as well as the status of the safety and integrity of the buildings.

SIGNIFICANCE

- The study will be of help to engineers/inspectors of aging structures
- DPWH and similar agencies will benefit, since monitoring and updating data on structure condition will be more efficient.
- Public will be safe knowing that these aging structures are far from causing damage.
- The study can help in the assessment of seismic risks.

SCOPE AND LIMITATIONS

- The study focuses on historical structures found in Intramuros. Like the San Agustin Church.
- Only the exterior part of these structures will be used for testing
- The parameters to be considered are the number of cracks, crack length, and crack width.
- An unmanned aerial vehicle or UAV will be used to monitor the chosen structures.
- The development and improvement of the UAV system will primarily focus on modifying commercially available UAVs for easier system integration and to be able perform autonomous commands

RESEARCH PHASES

1. Development and Improvement of the UAV system
2. Development of Autonomous system for raw data collection
3. Development of Control Center infrastructure, processes and algorithms
4. App development and software integration
5. Systems Integration
6. Soft Tests
7. Field deployment

Data Gathering

Drone

Building

Drone with raw
image data

Processing

Database

Post-processing system
